

Website, SEO, AEO & GEO Audit and Organic Growth Plan

A data-backed assessment of what is limiting organic traffic, engagement and purchases on vyraherbals.com — based on your Google Search Console, Google Analytics 4, Instagram exports and a full review of the website source code — with a prioritised plan to fix it.

Prepared: 19 August 2026 · **Scope:** SEO · AEO · GEO · Analytics · Codebase · Content · CRO

Sources reviewed: Google Search Console (Jan–Aug 2026) · GA4 traffic & engagement export · Instagram export (309 posts) · Live site crawl · Full website codebase (Next.js 15 + Supabase)

1. Executive Summary

Vyra Herbals has genuinely strong raw materials — a real founder story, ISO 9001:2015 & GMP certification, 309 pieces of social content, and category pages that **already rank on page 1 of Google**. Yet the website captures almost none of the organic demand that exists for its products. The audit found that this is not a content or marketing problem first — it is a **foundations problem**: every page on the site serves Google the same title tag, product pages are invisible until JavaScript runs, there is no structured data anywhere, and the sitemap lists only 8 of the site's pages. On top of this, analytics shows **zero tracked conversions despite active paid traffic and a live payment gateway** — meaning the business currently cannot measure what is working at all.

~11%

of sessions from Google organic — the rest depends on Instagram & direct

93%

of Google clicks are branded ("vyra") — high-intent buyers are not finding you

0

conversions tracked in GA4 — despite 120 sessions reaching the payment gateway

0

structured data items — no stars, prices or FAQ dropdowns in search results

THE ONE-SENTENCE DIAGNOSIS

The website is technically invisible to search engines at the moment of first crawl (client-side rendering, identical titles, no schema, 8-URL sitemap), and the business is flying blind commercially (broken conversion tracking) — while ~89% of traffic comes from an Instagram channel whose engagement has fallen from ~400 to ~50 average likes per post.

THE OPPORTUNITY

/category/hair-oil already ranks position 4.9 (446 impressions, 0.9% CTR) and **/category/shampoo at position 3.8**. These pages sit on page 1 with weak, generic snippets. Fixing titles, metas and schema alone — work measured in days, not months — is likely to multiply organic clicks before any new content is written. Layering a focused content plan and AI-search (GEO) optimisation on top builds a compounding traffic asset that paid ads can never provide.

Contents

2. What the data says	Traffic mix, search performance, social trend
3. What's not right — full findings register	13 issues, severity-rated, with evidence from data & code
4. Codebase audit detail	Exact files and code-level causes (for your developer)
5. The fix — phased improvement plan	Measurement → Technical SEO → Content/AEO/GEO → Authority → CRO
6. 90-day roadmap & KPI targets	Week-by-week execution with measurable outcomes

2. What the Data Says

2.1 Traffic is dangerously concentrated (GA4, Apr-Aug 2026)

Instagram (paid + referral + social) and direct visits account for **~89% of all sessions**. Google organic contributes just 254 sessions (~11%). Two details stand out: the payment gateway (pay.easebuzz.in) appears as a "referral" with 120 sessions — proof that **people are reaching checkout** — while GA4 records **0 conversions for every source, page and month**. E-commerce purchase tracking is not implemented, so no channel's true revenue contribution is visible. ChatGPT is already sending 8 sessions: a small but meaningful signal that AI assistants are discoverable as a channel (see §5.4 GEO).

2.2 Search performance: page-1 rankings, near-zero payoff (GSC, Jan-Aug 2026)

Finding	What it means
---------	---------------

Signal from Search Console		
Query mix	"vyra herbals" 29 clicks, "vyra" 9 clicks; all other queries ≈ 0	~93% of clicks are people who already know the brand. Non-brand buyers ("herbal hair oil for hair fall") are not being captured.
Category pages	/category/hair-oil: 446 impr., position 4.9 · /category/shampoo: 122 impr., position 3.8	Already page 1 — but 0.9% CTR because every page shows the same generic title/meta in results.
Brand collision	"vyra" — 6,407 impressions, position 6.4, CTR 0.14%	The brand name collides with Vyra AI / Vyra Pharma etc. Google is unsure which "Vyra" the site is — an entity-clarity problem (fixable via Organization schema + GBP).
Blog	All 7 posts rank positions 28–50 (pages 3–5)	Indexed but too thin to compete; several share the identical excerpt text.
Search appearance	Empty report	No rich results of any kind — no review stars, prices, breadcrumbs or FAQ dropdowns. Competitors get more clicks from the same position.
Devices	Mobile 5,808 impr. / pos 6.0 · Desktop 3,029 impr. / pos 8.7	58% of traffic is mobile; mobile rankings are the battleground.
Geography	India 4,485 impr. (Telangana strongest) · US 700 impr., 0 clicks	US impressions are the "vyra" brand collision; the real market is India — with an uncontested Telugu-language content lane.

2.3 The Instagram engine is weakening

Reels historically average ~397 likes and ~18k views, with one 73k-like viral outlier — but the **five most recent posts average ~50 likes**. Since Instagram feeds ~89% of site traffic, this decline directly threatens revenue and makes building organic search urgent rather than optional. The 229 existing video assets are, however, a reusable advantage (YouTube Shorts, Pinterest — see §5.5).

3. What's Not Right — Findings Register

Thirteen issues, severity-rated. Every finding is evidenced from your data exports, the live crawl, or the codebase (file references included for the development team; code-level detail in §4).

A. Measurement & Tracking

#	Finding	Severity	Evidence
1	No e-commerce purchase tracking. GA4 records 0 conversions sitewide while 120 sessions reach the payment gateway. The codebase's analytics module defines a <code>trackEvent</code> helper but it is never called anywhere — no <code>add_to_cart</code> , <code>begin_checkout</code> or purchase events exist.	CRITICAL	GA4 export (Conversions = 0 everywhere); <code>src/utils/analytics.ts</code> — zero call sites of <code>trackEvent()</code> in the codebase.
2	Payment gateway pollutes attribution. <code>pay.easebuzz.in</code> is not excluded as a referral, so returning customers restart as "payment referral" sessions and the true source loses credit. Meta Pixel is browser-only (no Conversions API), losing 20–40% of events.	HIGH	GA4 traffic-sources export; <code>src/Components/Common/FacebookPixel</code> — browser pixel only.

B. Technical SEO (mostly confirmed in code)

#	Finding	Severity	Evidence
3	Every page serves the identical title & meta description ("Vyra Herbals Premium Herbal Hair & Skincare Products"). Product, category and blog pages render as client components whose only SEO helper is a client-side <code>react-helmet</code> component — which executes after JavaScript runs, so first-crawl HTML contains only the root layout's defaults.	CRITICAL	Live crawl of <code>/</code> , <code>/product/...</code> , <code>/blogs/...</code> all return the same title; <code>app/layout.tsx</code> static <code>metadata</code> ; <code>SEOComponent.tsx</code> is <code>'use client'</code> + <code>react-helmet</code> ; zero <code>generateMetadata</code> in the entire codebase.
4	Money pages are client-side rendered. Product and category routes are thin server wrappers returning a <code>'use client'</code> component that fetches data in <code>useEffect</code> . Raw HTML of a product page contains ~800 characters of visible text and no H1 — Google must execute JS to see product names, prices, ingredients or reviews.	CRITICAL	<code>app/product/[productHandle]/page.js</code> (7 lines, no data fetch); <code>Singleproducts.tsx</code> fetches via <code>useEffect</code> at lines 80–236; 102 client components in the codebase.
5	Zero structured data (schema) sitewide. No Product/Offer/Review/FAQ/Article/Breadcrumb/Organization JSON-LD anywhere — hence the empty "Search appearance" report and no rich snippets (stars, price, availability).	CRITICAL	Live crawl: 0 JSON-LD blocks on home/product/blog; <code>grep for ld+json / schema.org</code> across the codebase: 0 matches.
6	Sitemap lists only 8 URLs — home, about, contact, cart, privacy, terms, faqs, track-order. Zero products, categories or blog posts. Google discovers the pages that make money by accident. Meanwhile <code>/cart</code> (88 impressions) and <code>/track-order</code> are being crawled and indexed.	CRITICAL	<code>app/sitemap.ts</code> — hardcoded 8-route array; live <code>sitemap.xml</code> confirms.

7	Duplicate product URLs split ranking signals. The same product is reachable at <code>/product/VYRA-0IL-100</code> , <code>/product/herbal-hair-oil</code> , <code>/product/hair-oil-100ml</code> — plus a live typo URL <code>/product/hVYRA-0IL-500</code> . No canonical tags exist anywhere in the code.	HIGH	GA4 pages export (same title across duplicate URLs); grep for <code>canonical</code> : 0 matches.
8	Index bloat & mixed signals. robots.txt disallows only <code>/api/</code> and <code>/admin/</code> . Utility pages (<code>/cart</code> , <code>/login</code> , <code>/checkout</code> , <code>/search results</code> , <code>/track-order</code>) are indexable; test pages (<code>app/test-coupon</code> , <code>test-delivery</code> , <code>test-order</code> , <code>test-coupon</code>) ship with the app. The <code>www</code> vs non- <code>www</code> host split is unresolved (both variants appear in GSC).	HIGH	<code>app/robots.ts</code> ; GA4 pages list (<code>/login</code> 24 sessions, <code>/search</code> 43); GSC shows both host variants.
9	Weak image SEO & heavy assets. Generic alt text (<code>alt="product"</code> on category cards; <code>{title}-image</code> on product cards). Blog hero PNGs are large; no compression pipeline beyond Next/Image.	MEDIUM	<code>ProductCard2.tsx</code> line 34: <code>alt="product"</code> ; <code>ProductCard.tsx</code> line 35.

FAIR CREDIT — WHAT THE CODEBASE DOES WELL

The codebase is not amateur work: security headers are genuinely best-in-class (full CSP, HSTS, frame protection), images use AVIF/WebP via Next/Image, TypeScript errors fail the build, and there's a working admin panel for products, blogs, reviews and coupons. **The SEO gaps are omissions, not incompetence — which means they are fast to fix.**

C. Content & On-Page

#	Finding	Severity	Evidence
10	Category pages have no supporting copy — just a product grid. No intro text, no "how to choose", no FAQ block. Yet these are the pages already ranking page 1.	HIGH	Live crawl of <code>/category/hair-oil</code> ; <code>Category.tsx</code> renders grid only.
11	Blog is thin (7 posts) with duplicated excerpts — several posts share the identical teaser ("Discover the profound benefits of Ayurvedic rituals..."). No author byline/schema despite an exceptional founder story sitting unused on <code>/about</code> .	HIGH	Live crawl of <code>/blogs</code> ; GSC positions 28–50 for all post queries.
12	FAQ page doesn't render for crawlers and has no FAQ schema ; high-intent question queries already appearing in GSC ("how often should you grease your scalp", "how many times a week should I oil my hair") have no dedicated answers.	HIGH	Live crawl of <code>/faqs</code> (JS accordion, content absent from HTML); GSC query export.
13	Trust assets are buried. ISO 9001:2015 & GMP certification, founder story, before/after testimonials exist but aren't structured (Person/Organization schema), surfaced on product pages, or used as E-E-A-T signals — the exact evidence Google and AI assistants reward in the YMYL-adjacent hair-care space.	MEDIUM	Live crawl of <code>/about</code> ; absence of schema (finding #5).

4. Codebase Audit Detail — For the Development Team

Stack confirmed: Next.js 15 (App Router) + Supabase, hosted on Vercel. This section translates each critical finding into its exact code location and the concrete change required.

Problem	Where in the code	Required change
Identical titles/metatags	<code>app/layout.tsx</code> exports one static <code>metadata</code> object. Page-level SEO is delegated to <code>src/Components/Shared/SEOComponent.tsx</code> — a 'use client' wrapper around <code>react-helmet</code>, which injects tags only after client JS runs. No file in the codebase uses <code>generateMetadata</code>.	Add export async function <code>generateMetadata({ params })</code> to <code>app/product/[productHandle]/page.js</code>, <code>app/category/[categoryName]/page.js</code> and <code>app/blogs/[slug]/page.tsx</code>, fetching the product/category/post server-side and returning unique <code>title</code>, <code>description</code>, <code>openGraph</code> and <code>alternates.canonical</code>. Delete the <code>react-helmet</code> component.
Client-rendered product/category pages	<code>app/product/[productHandle]/page.js</code> is a 7-line wrapper returning <code><Singleproducts /></code> ; <code>Singleproducts.tsx</code> fetches product data in <code>useEffect</code> (lines 80-236) via <code>fetch(API_PATH + '/products/detail')</code>. Same pattern in <code>Category.tsx</code>.	Convert product and category routes to server components: fetch from Supabase directly in the page (or a shared data layer), render H1, price, description, ingredients and reviews into the HTML. Keep interactive widgets (cart, sliders) as small client islands. Verify with GSC URL Inspection → "View crawled page".
No structured data	Grep for <code>ld+json</code> / <code>schema.org</code> across <code>app/</code>, <code>src/</code> : zero matches.	Inject JSON-LD server-side per route: <code>Product</code> + <code>Offer</code> + <code>AggregateRating</code> on PDPs; <code>FAQPage</code> on / <code>faqs</code> and PDP FAQ blocks; <code>BlogPosting</code> (<code>author = founder Person</code>) on posts; <code>Organization</code> + <code>WebSite</code> + <code>BreadcrumbList</code> in root layout. Validate with Google Rich Results Test.
8-URL sitemap	<code>app/sitemap.ts</code> — a hardcoded array of 8 static routes.	Make <code>sitemap()</code> async: query Supabase for all published products, categories and blog slugs and emit them with <code>lastModified</code>. Remove /<code>cart</code> and /<code>track-order</code>. Resubmit in GSC.
Duplicate product URLs	Route param is <code>[productHandle]</code> ; multiple DB handles resolve to the same product (SKU slugs, keyword slugs, a typo slug <code>hVYRA-0IL-500</code>). No canonicals, no redirects.	Choose one canonical handle per product; add <code>alternates.canonical</code> in <code>generateMetadata</code> ; 301-redirect legacy/typo handles in <code>next.config.ts</code> <code>redirects()</code> or in-page via <code>permanentRedirect()</code>.
Index bloat & test pages	<code>app/robots.ts</code> disallows only /<code>api/</code> and /<code>admin/</code>. <code>app/</code> contains <code>test-coupon</code>, <code>test-delivery</code>, <code>test-order</code>, <code>test-delivery</code>, <code>transaction</code>, <code>payment-failed</code>. Utility routes carry no <code>noindex</code>.	Delete test routes before deploy. Add <code>robots: { index: false }</code> metadata to <code>cart</code>, <code>checkout</code>, <code>login</code>, <code>signup</code>, <code>profile</code>, <code>search</code>, <code>track-order</code>, <code>wishlist</code>, <code>orders</code>, <code>payment-failed</code>. Add <code>/search</code> to robots disallow. 301 <code>www</code> → apex (or vice-versa) at Vercel level.
No conversion events	<code>src/utils/analytics.ts</code> defines <code>trackEvent()</code> (GTM <code>dataLayer</code> + <code>fbq</code>) but a codebase-wide search finds no call sites. GA4 loads via <code>gtag</code> (G-	Fire <code>view_item</code> (PDP view), <code>add_to_cart</code>, <code>begin_checkout</code>, and <code>purchase</code> (on the order-placed page, with value/currency/items) through <code>trackEvent</code>. In GA4, mark <code>purchase</code> a key event and add <code>pay.easebuzz.in</code> to unwanted referrals. Add

	K0F7N513MS) in app/layout.tsx with only base pageviews.	Meta Conversions API server-side for the same events.
Image alt text	ProductCard2.tsx:34 — alt="product" ; ProductCard.tsx:35 — alt={`\${product.title}-image`}.	Descriptive alts: `\${product.title} – herbal hair oil with rosemary & neem, 100ml`-style templates; unique alts per gallery image.

5. The Fix — Phased Improvement Plan

Phase 0 • Measurement First (Week 1 — nothing else matters until this is done)

1. **GA4 e-commerce via GTM:** implement `view_item`, `add_to_cart`, `begin_checkout`, `purchase` with value, currency and item metadata; mark purchase as a key event.
2. **Referral exclusion** for `pay.easebuzz.in` so purchases attribute to their true source.
3. **Meta Conversions API** (server-side) alongside the browser pixel; enhanced conversions; consent mode.
4. **Looker Studio dashboard:** organic sessions, non-brand clicks, revenue by channel, conversion rate — reviewed monthly.

Phase 1 • Technical SEO Foundation (Weeks 1-4)

1. **Unique titles & metas on every page** (server-side `generateMetadata`). Ready-to-use examples:

Page	Title	Meta description
/category/hair-oil	Herbal Hair Oil for Hair Fall & Growth — 100% Natural Vyra Herbals	Shop Ayurvedic hair oil with rosemary, neem & 9 herbs. Reduces hair fall, promotes regrowth. ISO & GMP certified. Free shipping across India.
/category/shampoo	Herbal Shampoo — Sulphate & Paraben Free for All Hair Types Vyra	Gentle Ayurvedic shampoo that cleanses without stripping natural oils. Chemical-free, made in India. Free shipping.
/product/[oil-100ml]	Vyra Herbal Hair Oil 100ml — Reduces Hair Fall Naturally ₹ [price]	100% natural hair oil with rosemary & neem. [N] happy customers. COD available. Free shipping across India.

Why first: /category/hair-oil already sits at position 4.9 with 0.9% CTR. Lifting CTR to ~3% triples clicks from existing rankings — zero new content required.

2. **Server-render product, category and blog pages** (H1, description, price, reviews in raw HTML).
3. **Structured data sitewide:** Product+Offer+AggregateRating, FAQPage, BlogPosting+Person, Organization+WebSite, BreadcrumbList, HowTo on tutorial posts.
4. **Rebuild sitemap** from the database (all products/categories/posts); resubmit in GSC.
5. **Canonicals + 301s** for duplicate product URLs and the typo slug; **noindex** cart/checkout/login/search/track-order; delete test routes; consolidate www vs apex host.
6. **Core Web Vitals pass on mobile** (58% of traffic): compress blog hero images, lazy-load below-fold media.

Phase 2 • Content Engine for High-Intent Traffic (Months 1-3)

1. **Category pages → ranking hubs:** 300–500 words of buying-guide copy + 4–6 question FAQ block (FAQ schema) on each category. Add a dedicated `/category/rosemary` page — "rosemary leaves for hair growth" queries already generate impressions (pos 29–69) with no landing page.
2. **Product pages → conversion-grade:** unique 150–250 word descriptions (ingredients, benefits, usage, who it's for), on-page product FAQs, visible reviews, descriptive alt text.
3. **Blog → answer engine** (4–6 posts/month, answer-first format — direct 40–60 word answer up top, depth below). Prioritised first topics, mapped to your GSC data:

#	Topic	Intent / Funnel
1	Best Herbal Hair Oil for Hair Fall in India (2026) — honest comparison incl. Vyra	Commercial · Bottom
2	Vyra Hair Oil Review: Ingredients, Results, Who It's For (owns the existing "vyra reviews" query — 14 impressions, 0 clicks, no page today)	Branded · Bottom
3	How to Use Rosemary Leaves for Hair Growth — 3 methods with measurements (expand the pos-29 post)	Informational · Middle
4	Hair Oiling: How, When & How Often — expand to 1,500+ words, add HowTo schema (currently pos 49)	Informational · Middle
5	Onion vs Rosemary vs Neem Oil for Hair — what the evidence says	Comparison · Middle
6	Why Is My Hair Falling? 9 causes & the Ayurvedic fix for each	Informational · Top
7	Sulphate-Free Shampoo: what it actually means and who needs it	Informational · Middle
8	Postpartum hair fall, premature greying, dandruff routines (long-tail set)	Long-tail · Top

4. **Internal linking:** every post links to its category page; every category to products; add related-products modules.
5. **E-E-A-T surfacing:** founder byline + bio box (Person schema) on every post; certifications in footer; Quality & Certifications section on /about.

Phase 3 · AEO & GEO — Winning the Answer Engines (Months 2-4)

- **AEO (featured snippets / People Also Ask / voice):** every page opens with a 40–60 word direct answer; FAQ sections written in the exact phrasing already in your GSC ("how many times a week should I oil my hair"); FAQPage + HowTo schema as the technical unlock; grow /faqs into a 25–30 question hub.
- **GEO (ChatGPT, Gemini, Perplexity, AI Overviews)** — ChatGPT already sends you sessions; compound it:
 - **Entity clarity:** Organization schema with consistent name/founder/certifications + sameAs links to Instagram & marketplaces.
 - **Quotable specificity:** "formulated with 9 Ayurvedic herbs; ISO 9001:2015 & GMP certified; founded by Sahera Banu after her own hair-loss journey" — AI models cite specifics, not adjectives.
 - **Comparison/listicle content** (topics 1 & 5 above) — the format AI assistants cite most for "best X" queries.
 - **Add /llms.txt** summarising brand, products and key URLs for AI crawlers.
 - **Off-site surfaces AI reads:** Amazon/Flipkart listings, Google Business Profile, genuine Quora/Reddit answers, YouTube.

Phase 4 · Authority, Local & Off-Page (Months 2-6)

1. **Google Business Profile** (Hyderabad/Telangana): products, photos, posts, review collection — so "vyra reviews" / "vyra official website" queries are answered by your properties.
2. **Review flywheel:** post-purchase WhatsApp/email review requests → Google reviews + on-site reviews (feeds star schema) + Instagram UGC reshares.

3. **Marketplace presence:** keyword-rich Amazon.in / Flipkart listings capture existing demand and build brand-entity signals that feed GEO.
4. **Founder-story digital PR:** the "homemade remedy → certified brand" journey and the KTR reshare moment are pitchable to Telugu media and founder-story outlets — each mention is a backlink + entity signal.
5. **Repurpose the 229 existing videos** to YouTube Shorts and Pinterest — evergreen, link-carrying channels in a top-3 Pinterest category.

Phase 5 · Convert the Traffic (CRO quick wins, alongside)

- **WhatsApp click-to-chat** on product pages (proven lift for Indian D2C).
- COD availability, shipping timelines and returns visible **on the product page**, not buried in FAQs.
- Reviews + before/after UGC on PDPs (you have thousands of Instagram comments worth of customer passion — import it).
- Bundle prompts on the hair-oil PDP ("Complete Hair Care Kit — save ₹X"); sticky Add to Cart on mobile.
- Dedicated landing pages matched to Instagram campaigns instead of sending paid traffic to the homepage.
- Phase 0 data will reveal the real drop-off: 13 checkout sessions with 0 tracked conversions is either broken tracking or checkout friction — the new events will tell you which.

6. 90-Day Roadmap & KPI Targets

Weeks	Workstream	Deliverables
1-2	Phase 0 + fastest wins	GA4 e-commerce events live · referral exclusion · unique titles/metatags on top 10 pages · sitemap rebuilt from DB & resubmitted
3-4	Phase 1 technical	SSR for product/category/blog · schema deployed sitewide · canonicals + 301s + noindex · test routes removed · www consolidation
5-8	Phase 2 content	Category-page copy live · 6 new/expanded blog posts · PDP rewrites · FAQ hub to 25+ questions · internal linking
9-12	Phases 3-4	Comparison/listicle content · /llms.txt · Google Business Profile · marketplace listings · review flywheel · founder-story PR outreach

KPI	Baseline (today)	90-day target	How it's measured
Non-brand organic clicks	~5 / month	50+ / month	GSC, brand queries filtered out
Organic sessions	254 (period)	2x and growing	GA4
Category-page CTR	0.9%	3%+	GSC page report
Rich-result impressions	0 (no schema)	Stars / FAQ / price appearing	GSC Search Appearance
AI-assistant referrals	8 sessions (ChatGPT)	25+ sessions	GA4 referral report
Revenue from organic	Unmeasurable today	First tracked organic purchases; ≥1% organic CVR	GA4 key events

BOTTOM LINE

Vyra Herbals does not have a traffic problem first — it has a **foundations problem** (identical titles, client-rendered money pages, no schema, an 8-page sitemap, untracked conversions) sitting on top of genuinely strong assets (page-1 category rankings, real certifications, a compelling founder story, a proven video content engine). Fix the foundations in weeks 1-4, and every rupee of content and authority work after that compounds instead of leaking. The plan above is sequenced so the cheapest, highest-certainty wins come first.

Prepared from: Google Search Console performance exports (Jan 1 – Aug 18, 2026) · GA4 traffic & engagement export (Apr-Aug 2026) · Instagram post export (309 posts, 2023-2026) · live crawl of vyraherbals.com (19 Aug 2026) · full review of the vyra-herbals-main codebase (Next.js 15 + Supabase). All findings verifiable against these sources.
